

Slurry Flanged Knife Gate Valve SKF

HEAVY DUTY Slurry Knife Gate Valve with flange connections isolates flow in the most demanding process conditions. The complete valve is built around an ease of maintenance concept.

The Flowrox SKF contains only three service parts; ring sleeves, upper seal and the valve gate.

USABILITY BASED ON DESIGN

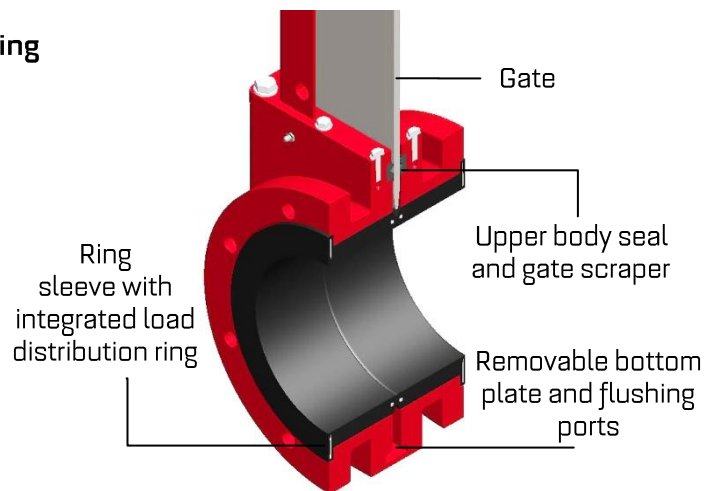

Flowrox SKF belongs to a new generation knife gate valve series.

The valve designs throughout the series are born from the many years of experience Flowrox has gained, providing solutions for abrasive and corrosive process applications.

Distribute the load – Flowrox SKF features a new load distribution ring that prevents over compression and ensures 100% sealing between the ring sleeve and the valve gate. To add to ease of maintenance, the load ring has been integrated into valve sleeves.

Act freely – The universal tower design of the valve accommodates most actuator types, allowing for actuator interchangeability after valve installation. The tower also ensures that the top plate, body and actuator are always aligned with the pipeline and the gate is in the right position.

Make it simple – The valve body of Flowrox SKF is one piece and takes away the need for sealing between the body halves.

Benefits in the process

- Bi-directional flow tolerates backflow
- Free flow of the process medium
- 100% isolation
- Only the ring sleeves in contact with the process medium
- Integrated load distribution ring
- Integrated upper body seal and gate scraper
- Removable bottom plate accommodates flushing ports
- Face-to-face according to industry standard

Type marking example: SKF100M10-20S0-NR-R1

Standard features

- Gate lock out pins (M, MG & A actuators)
- Bottom plate with flushing ports
- Stem protection (M, MG & E actuators)
